Regular Expression

Regular Expression

WHAT A special text string for describing a search pattern

For searching, replacing, and parsing text with complex patterns of characters

WHY Processes large amounts of text over and over again / Extremely fast

Usually this pattern is then used by **string searching** algorithms

For find or find and replace operations on strings, or for *input validation*

BUT, There is a *learning curve*

General Concepts

REGEX | General Concepts

- ☐ Alternative:
- ☐ Grouping: 0
- \square Quantification: ? + * {m,n}
- ☐ Anchors: ^\$
- ☐ Meta-characters: .[][-][^]
- ☐ Character Classes: \w \d \s \W ...

Meta Characters

- . Any character
- * Zero, one or more
- + One or more
- **?** Zero or one
- {} Specified number of occurrences

정규표현식	표현	설명
^x	Start of Line - "x" -	문자열이 x로 시작합니다.
x\$	● "x" — End of Line —	문자열이 x로 끝납니다.
.x	• any character • "x"	임의의 한 문자를 표현합니다. (x가 마지막으로 끝납니다.)
X+	~_ "x" ~	x가 1번이상 반복합니다.
x?	"x"	x가 존재하거나 존재하지 않습니다.
x*	"x"	x가 0번이상 반복합니다.
x y	•{ "x" }•	x 또는 y를 찾습니다. (or연산자를 의미합니다.)
(x)	Group #1	()안의 내용을 캡쳐하며, 그룹화 합니다.
(x)(y)	Group #1 Group #2	그룹화 할 때, 자동으로 앞에서부터 1번부터 그룹 번호를 부여해서 캡쳐합니다. 결과값에 그룹화한 Data가 배열 형식으로 그룹번호 순 서대로 들어갑니다.
(x)(?:y)	Group #1	캡쳐하지 않는 그룹을 생성할 경우 ?:를 사용합니다. 결과값 배열에 캡쳐하지 않는 그룹은 들어가지 않습니 다.
x{n}	"x" n times	x를 n번 반복한 문자를 찾습니다.
x{n,}	"x" n + times	x를 n번이상 반복한 문자를 찾습니다.
x{n,m}	"x")	x를 n번이상 m번이하 반복한 문자를 찾습니다.

n ... m

Meta Characters

- [] Check any single character
- [-] Range of characters
- [^] Negation
- A Beginning of string
- \$ End of string
- () Grouping

정규표현식	표현	설명
[xy]	One of: "X" "y"	x,y중 하나를 찾습니다.
[^xy]	None of: "x" "y"	x,y를 제외하고 문자 하나를 찾습니다. (문자 클래스 내의 ^는 not을 의미합니다.)
[x-z]	One of: - "z" - "z" -	x~z 사이의 문자중 하나를 찾습니다.
₩^	O - "^" O	^(특수문자)를 식에 문자 자체로 포함합니다. (escape)
₩b	• word_boundary	문자와 공백사이의 문자를 찾습니다.
₩В	on_word_boundary	문자와 공백사이가 아닌 값을 찾습니다.
₩d	digit -	숫자를 찾습니다.
₩D	on_digit -	숫자가 아닌 값을 찾습니다.
₩s	white_space -	공백문자를 찾습니다.
₩S	on_white_space	공백이 아닌 문자를 찾습니다.
₩t	tab -	Tab 문자를 찾습니다.
₩∨	vertical_tab	Vertical Tab 문자를 찾습니다.
₩w	word -	알파벳 + 숫자 + <u></u> 를 찾습니다.
₩W	on_word	알파벳 + 숫자 + _ 을 제외한 모든 문자를 찾습니다.

Greedy vs. Lazy

Greedy Tries to find the last possible match

Lazy Tries to find the first possible match

Greedy quantifier	Lazy quantifier	Description
 k	*?	Match zero or more times.
+	+?	Match one or more times.
?	??	Match zero or one time.
{n}	n}?	Match exactly n times.
{n,}	{n,}?	Match at least n times.
{n,m}	{n,m}?	Match from n to m times.

Add a ? to a quantifier to make it ungreedy i.e lazy.

Example:

test string: stackoverflow

greedy reg expression: s.*o output: stackoverflow lazy reg expression: s.*?o output: stackoverflow

re

import re

re.compile(pattern, flags=0)

Compile a regular expression pattern into a regular expression object, which can be used for matching using its match(), search() and other methods, described below.

re. search(pattern, string, flags=0)

Scan through *string* looking for the first location where the regular expression *pattern* produces a match, and return a corresponding match object. Return None if no position in the string matches the pattern; note that this is different from finding a zero-length match at some point in the string.

re.match(pattern, string, flags=0)

If zero or more characters at the beginning of *string* match the regular expression *pattern*, return a corresponding match object. Return None if the string does not match the pattern; note that this is different from a zero-length match.

Note that even in MULTILINE mode, re.match() will only match at the beginning of the string and not at the beginning of each line.

re. **split**(pattern, string, maxsplit=0, flags=0) ¶

Split *string* by the occurrences of *pattern*. If capturing parentheses are used in *pattern*, then the text of all groups in the pattern are also returned as part of the resulting list. If *maxsplit* is nonzero, at most *maxsplit* splits occur, and the remainder of the string is returned as the final element of the list.

```
data = """
park 800905-1049118
kim 700905-1059119
"""

result = []
for line in data.split("\n"):
    word_result = []
    for word in line.split(" "):
        if len(word) == 14 and word[:6].isdigit() and word[7:].isdigit():
            word = word[:6] + "-" + "*******"
        word_result.append(word)
    result.append(" ".join(word_result))
print("\n".join(result))
```

```
data = """
park 800905-1049118
kim 700905-1059119
"""

pat = re.compile("(\d{6})[-]\d{7}")
print(pat.sub("\g<1>-********, data))
```

```
p = re.compile('Crow Servo')
m = p.match('CrowHello')
print(m)
print(re.search('^Life', 'Life is too short'))
print(re.search('^Life', 'My Life'))
print(re.search('short$', 'Life is too short'))
print(re.search('short$', 'Life is too short, you need python'))
p = re.compile('(ABC)+')
m = p.search('ABCABCABC OK?')
print(m.group())

print(p.search('no class at all'))
print(p.search('one subclass is'))
print(p.search('the declassified algorithm'))
p = re.compile(r'\Bclass\B')
print(p.search('no class at all'))
print(p.search('one subclass is'))
print(p.search('the declassified algorithm'))
p = re.compile(r'' + s + d + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] + [-] +
m = p.search("park 010-1234-1234")
print(m)
p = re.compile(r''(\w+)\s+\d+[-]\d+[-]\d+")
m = p.search("park 010-1234-1234")
print(m.group(1))
```

```
Match.group([group1, ...])
```

Returns one or more subgroups of the match. If there is a single argument, the result is a single string; if there are multiple arguments, the result is a tuple with one item per argument. Without arguments, group1 defaults to zero (the whole match is returned). If a groupN argument is zero, the corresponding return value is the entire matching string; if it is in the inclusive range [1..99], it is the string matching the corresponding parenthesized group. If a group number is negative or larger than the number of groups defined in the pattern, an IndexError exception is raised. If a group is contained in a part of the pattern that did not match, the corresponding result is None. If a group is contained in a part of the pattern that matched multiple times, the last match is returned.

 method
 목적

 group()
 매치된 문자열을 리턴한다.

 start()
 매치된 문자열의 시작 위치를 리턴한다.

 end()
 매치된 문자열의 끝 위치를 리턴한다.

 span()
 매치된 문자열의 (시작, 끝) 에 해당되는 튜플을 리턴한다.

```
m = re.match(r"(\w+) (\w+)", "Isaac Newton, physicist")
print(m.group(0))
print(m.group(1))
print(m.group(2))
print(m.group(1, 2))
```

```
p = re.compile(r"(\w+) (\w+)")
m = p.search("Isaac Newton, physicist")
print(m.group())

p.sub("\g<2> \g<1>", "Isaac Newton, physicist")
```
